Kiuwan Governance

Kiuwan Governance has been designed for **Security/QA Engineers or IT Managers.**

It shows grouped results of the analyses performed on the account code grouped by portfolios; a piece of essential information for managing the applications at an executive level.

Kiuwan is the only cloud solution that allows you to make decisions about your application portfolio, compare applications, see the evolution, explore the best repair scenario to fit your needs and resources and help to decide if an application has to be conserved, optimized or replaced.

By using Kiuwan Governance you will get:

- Complete visibility of your **entire** application portfolio

- Objective information to negotiate your **SLA's**

- Measure external **providers' contributions** and understand their path from a unique vantage point.

Kiuwan Governance lets you make informed decisions through Enterprise Software Analytics tools such as:

- **Decision quadrants**

    - Detect risky applications using different decision quadrants

- **Evolution**

    - Predictive analytics of the evolution of your application's portfolio.

- **Activity**

    - Record the activity of your development teams and software vendors, both in application and maintenance projects or change requests.
