Manual SAPEX Installation

Local vs Remote Kiuwan Analysis

To analyze ABAP code with the Kiuwan Solutions, the source code and information from the SAP system need to be exported before they can be analyzed.

Once the source code is exported, the Kiuwan Solutions let you implement two different approaches on the **location where the ABAP code is analyzed**.

- To execute Kiuwan analyses within the SAP server (**local**), or
- To execute analyses from an external server (**remote**)

Depending on your approach, the installation takes different steps.

We will use the terms **local** and **remote** for specific installation steps, and **both** for common (mandatory) steps.

SAPEX Installation Files

SAPEX installation files are contained in `sapex_abap_code.zip`, located in the `$(AGENT_HOME)/resources/abap` directory of your Kiuwan Local Analyzer installation.

Please visit [Kiuwan Local Analyzer](#) for further help on Kiuwan Local Analyzer.

The following table lists contents of `sapex_abap_code.zip`

File	Behaviour	Notes
Programs:		
ZKW_SAPEX_CO DE	Export source code	Exports to local or remote directory

ZKW_SAPEX_ME_TADATA	Export SAP information	Exports to local or remote directory
ZKW_ANALYSIS	Analyzes source code (after optional previous export) in SAP system	
RFC-enabled Function modules:		
ZKW_SAPEX_CO_DE_RPC	Export source code	Needed by sapexCode.xmlremote script
ZKW_SAPEX_ME_TADATA_RPC	Export metadata	Needed by sapexMetadata.xmlremote script
ZKW_SAPEX_LO_ADFILE_RPC	For downloading an exported file	Needed by sapexCode.xmlremote script
ZKW_SAPEX_RM_DIR_RPC	For removing directories where source code is exported	
ZKW_SAPEX_RM_DIR_CHECK	Security check for RMDIR calls	
Classes:		
ZKW_CL_*, ZKW_CX_*	Support classes	Add them using class builder or Eclipse ADT
ZCL_IM_KW_BAD_I_REQ_CHECK	Implementation BAdI for CTS_REQUEST_CHECK	Sample BAdI for automated audit before release of a transport request

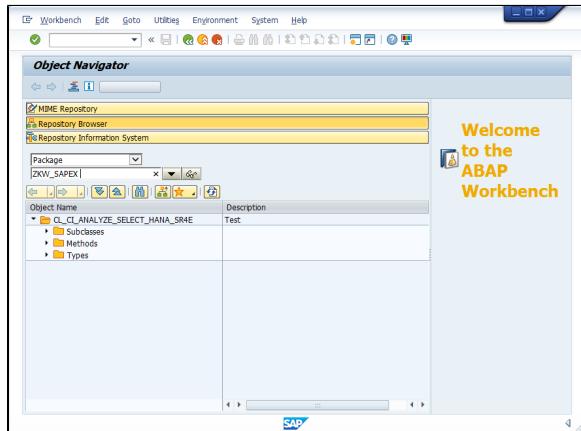

- Note 1: It is recommended to **create a package named ZKW_SAPEX** to hold all entities created for SAPEX.
- Note 2: You may use ABAP Workbench / ABAP Editor or Eclipse-based ABAP Development Tool to create the SAPEX elements from the provided code.
- Note 3: **Remember to activate all ABAP elements installed, to enable the execution.**

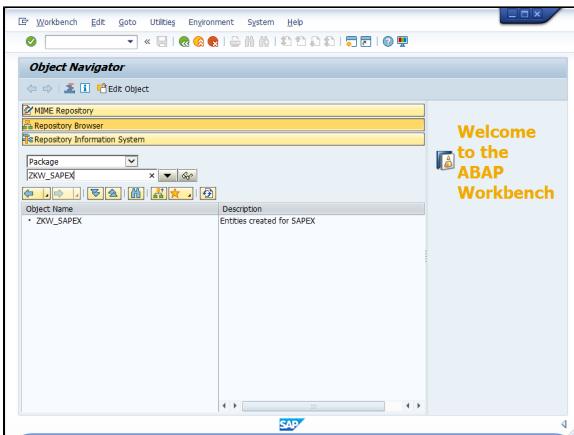

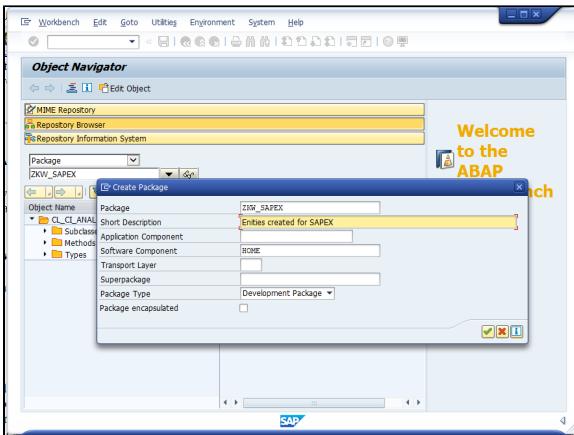

Common Installation steps for Local and Remote scenarios

1.Create ZKW_SAPEX package

It is recommended to create a package named **ZKW_SAPEX** to hold all entities created for SAPEX.

To create the **ZKW_SAPEX** package you can use the transaction **SE80** as follows:

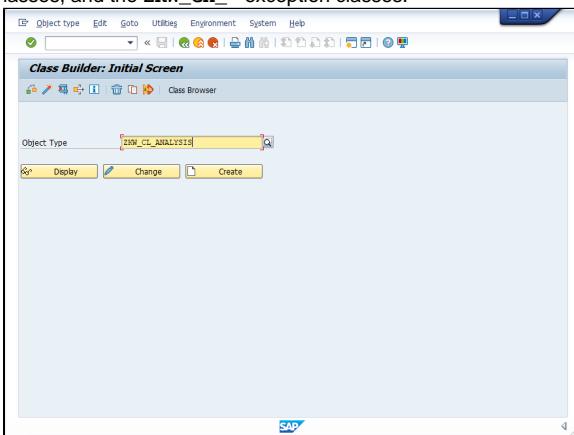

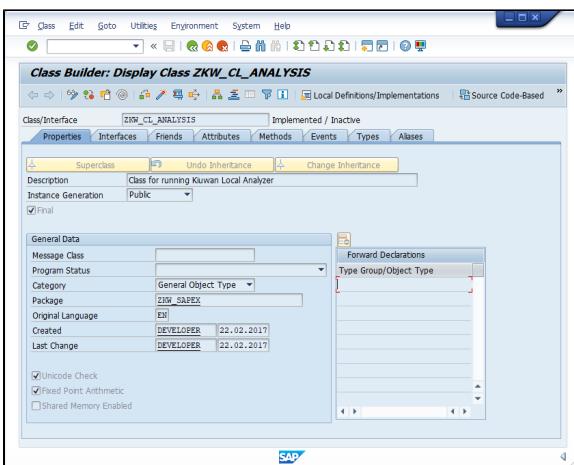

After creating the ZKW_SAPEX package, you can follow the next steps.

2. Install support classes

Using the Class Builder (transaction **SE24**) in source code mode, create and activate all the **ZKW_CL_*** classes, and the **ZKW_CX_*** exception classes.

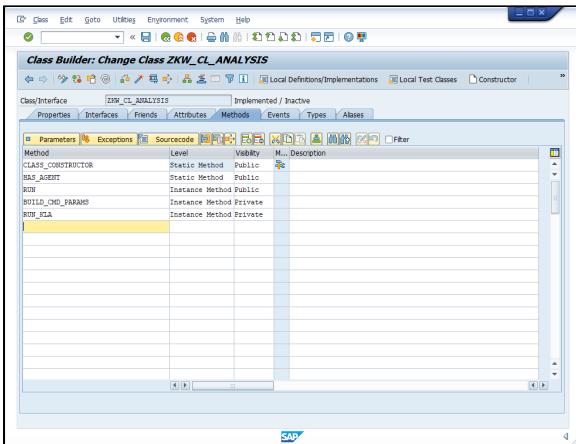

Google to **Source Code - Based Class Builder** and paste the content of the source file (substituting any previous content).

```

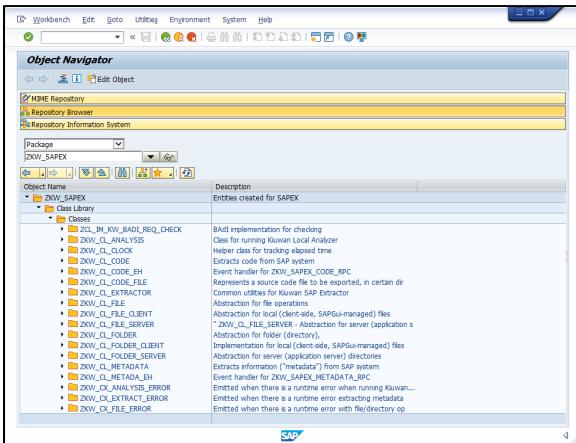

1 " ZKW_CL_ANALYSIS - Class for running Kiuwen Local Analyzer
2 "
3 " Requires a ZKW_MLA_AGENT command registered (tcode CM69)
4 " for running the shell script agent.sh (or agent.cmd for windows)
5 " under the <AGENT_HOME>/bin directory of the Kiuwen analyzer
6 " deployed in the SAP system.
7 "
8 " Useful, for example, for registering a RADI enhancement for
9 " IF_EX_CTS_REQUEST_CHECK-CHECK BEFORE RELEASE that extracts sources
10 " for the change request, analyzes them, and blocks the release
11 " when the audit checkpoints do not pass.
12 "
13 " Program ZKW_SAPEX_ANALYSIS use this class for analysis in SAP system.
14 "
15 class ZKW_CL_ANALYSIS definition
16 public.
17 final.
18 create public.
19 "
20 public section.
21 "
22   " Command to execute, when enabled
23   constants: ANALYSIS_CMD type string value 'ZKW_MLA_AGENT'.
24 
```

Switch back to **Form-Based Class Builder** to see the complete class.

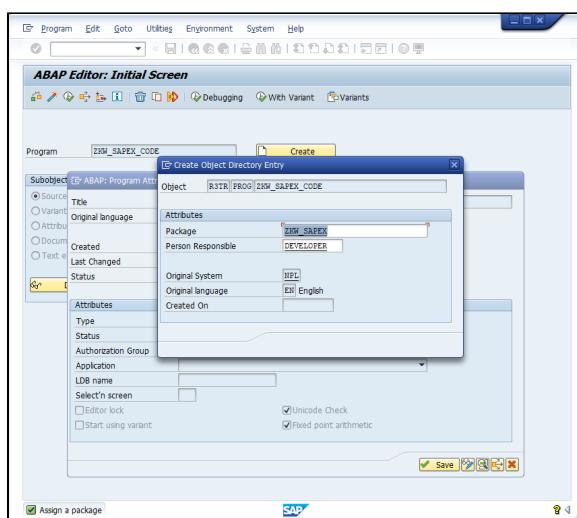

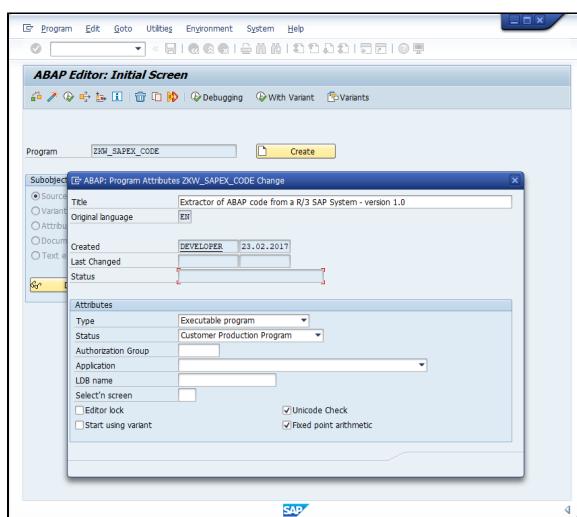

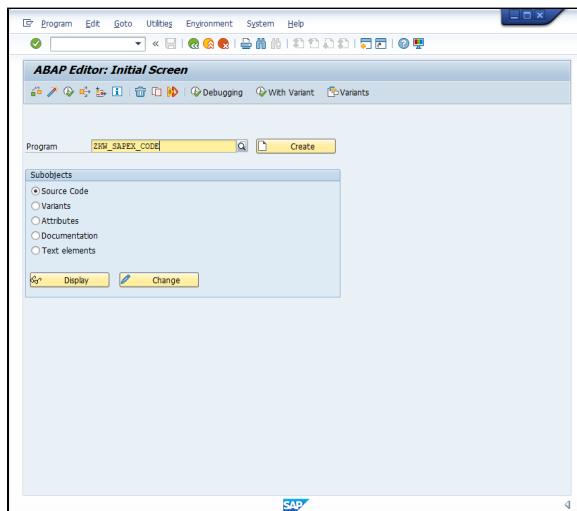

Do not forget to **Activate** every class after creation.

After importing all the classes you will see them under the **ZKW_SAPEX** package:

3. Install source code extraction programs

Using the ABAP Editor (transaction **SE38**), create the **ZKW_SAPEX_CODE** and **ZKW_SAPEX_METADATA** programs

Open the **Source view**.

The screenshot shows the SAP ABAP Editor interface. The title bar reads "ABAP Editor: Change Report ZKW_SAPEX_CODE". The menu bar includes "Program", "Edit", "Goto", "Utilities", "Environment", "System", and "Help". The toolbar contains various icons for file operations like Open, Save, Print, and Copy/Paste. The main area displays the ABAP source code:

```
Report  ZKW_SAPEX_CODE  Inactive
1  *$-- Report ZKW_SAPEX_CODE
2  *$-
3  *$-
4  *$-
5  *$-
6  REPORT ZKW_SAPEX_CODE.
7
```

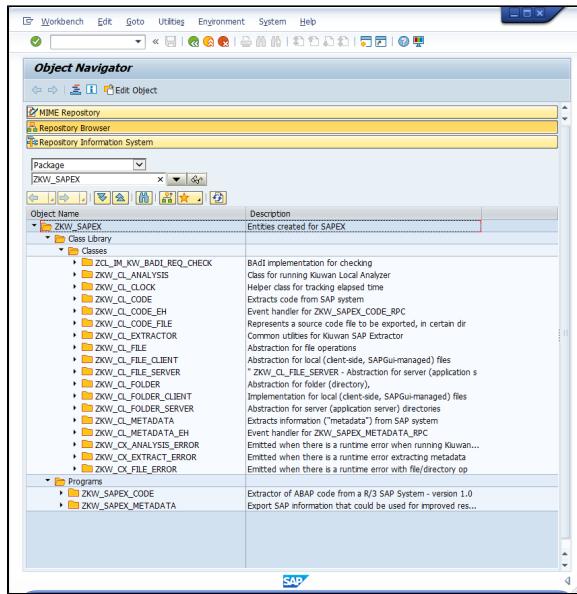

The status bar at the bottom indicates "Attributes for program ZKW_SAPEX_CODE saved" and "SAP".

and paste the source code provided by SAPEX.

The screenshot shows the SAP ABAP Editor interface with the title bar "ABAP Editor: Change Report ZKW_SAPEX_CODE". The menu bar and toolbar are identical to the first screenshot. The main area now displays a much longer ABAP source code listing, starting with lines 678 and ending with line 702. The code includes various ALV grid rendering logic and error handling. The status bar at the bottom indicates "Program ZKW_SAPEX_CODE saved" and "SAP".

After saving, you will see all the SAPEX objects.

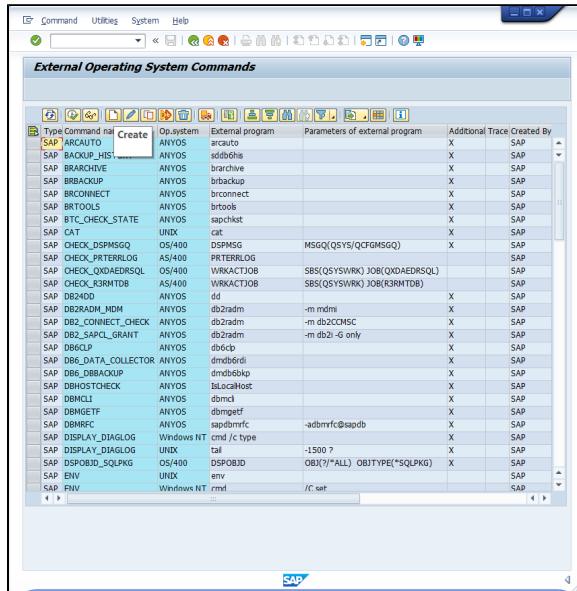

Do not forget to activate all the created objects.

4.Create OS commands (ZKW_MKDIR and ZKW_RMDIR)

Using transaction **SM69**, create the following OS commands:

- **ZKW_MKDIR**
- **ZKW_RMDIR**

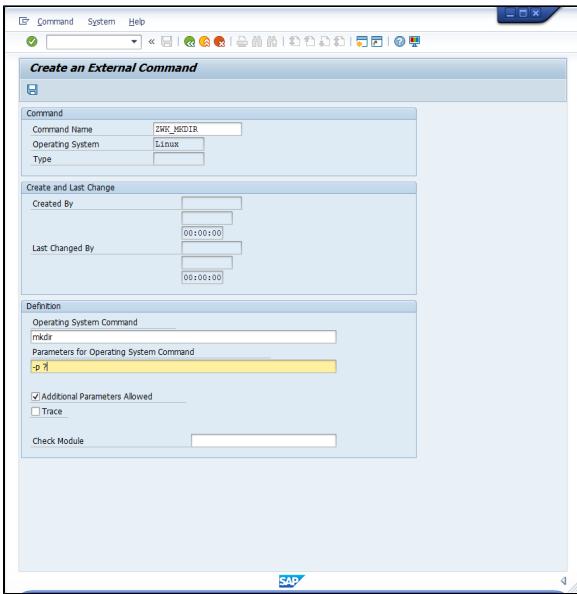

ZKW_MKDIR

Used for creating directories in the SAP system:

- `mkdir -p ?` for Unix
- `cmd /C mkdir ?` for Windows

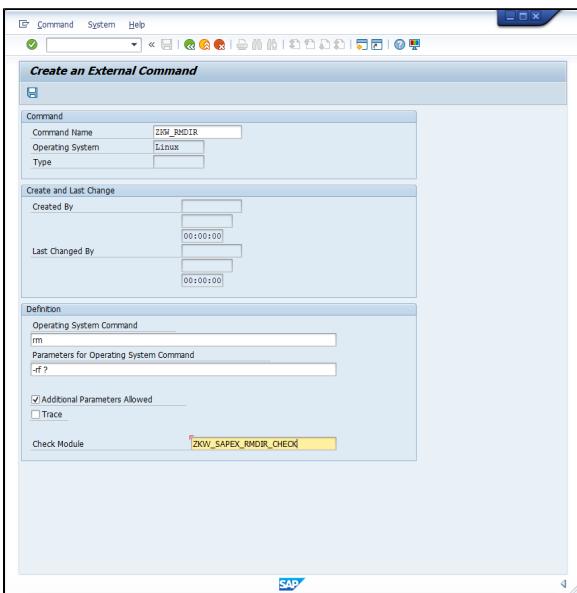

Note: The command configured must create all intermediate directories.

ZKW_RMDIR

Used for deleting a directory and all its contents in the SAP system:

- rm -rf ? for Unix
- cmd /C rmdir /s /q ? for Windows.

To ensure that a proper rmdir command is selected, **register the ZKW_SAPEX_RMDIR_CHECK** to avoid security issues.

This ensures that the command is one of the allowed RMDIR commands, and that the target directory is either sapex code or metadata directories, or a raw subdir under these directories.

ZKW_RMDIR performs a recursive deletion!

To avoid unintended deletions, be sure the target directory does not contain directories out of the SAPEX code/metadata directories.

The result of creating the commands should be similar to the following:

External Operating System Commands						
Type	Command name	Operating system	Name of external program	Parameters	Check module	Adv.
Custom...	ZKW_RMDIR	Linux	rm	-rf	ZKW_SAPEX_RMDIR_CHECK X	
Custom...	ZKW_MKDIR	WINDOWS NT	cmd	/C rmdir /s /q ?	ZKW_SAPEX_RMDIR_CHECK X	X
Custom...	ZKW_MKDIR	Linux	mkdir	-p ?	ZKW_SAPEX_RMDIR_CHECK X	X
Custom...	ZKW_MKDIR	WINDOWS NT	cmd	/C mkdir ?	ZKW_SAPEX_RMDIR_CHECK X	

Installation steps for Local scenario

1. Install Programs to execute Local Analysis

If you decide to use the local approach:

- Install [Kiuwan Local Analyzer](#) in the SAP system, and
- Using the ABAP Editor (transaction **SE38**), create and activate **ZKW_ANALYSIS** program

It is recommended to use a <DIR_HOME>/sape4k/kla directory for the Kiuwan Local Analyzer.

2. Create OS command to launch the analysis (ZKW_KLA_AGENT)

Used for launching the Kiuwan Local Analyzer script.

This OS command will be used by **ZKW_ANALYSIS** program and **CTS_REQUEST_CHECK** BAdI implementation.

Use :

- <PATH_TO_KLA>/bin/agent.sh (Unix), or
- <PATH_TO_KLA>\bin\agent.cmd (Windows)

as the name of the **Operating System Command** parameter in transaction **SM69**.

Change Command "ZKW_KLA_AGENT" for "Linux"

Command	Command Name: ZKW_KLA_AGENT Operating System: Linux Type: Customer
Create and Last Change	Created By: DEVELOPER Created Date: 22.02.2017 Last Changed By: DEVELOPER Last Changed Date: 22.02.2017
Definition	Operating System Command: /usr/sap/NPL/D00/work/sape4k/kla/KiuwanLocalAnalyzer/bin/agent.sh Parameters for Operating System Command: <input type="text"/> Additional Parameters Allowed: <input checked="" type="checkbox"/> Trace: <input type="checkbox"/> Check Module: <input type="text"/>

Installation steps for Remote scenario

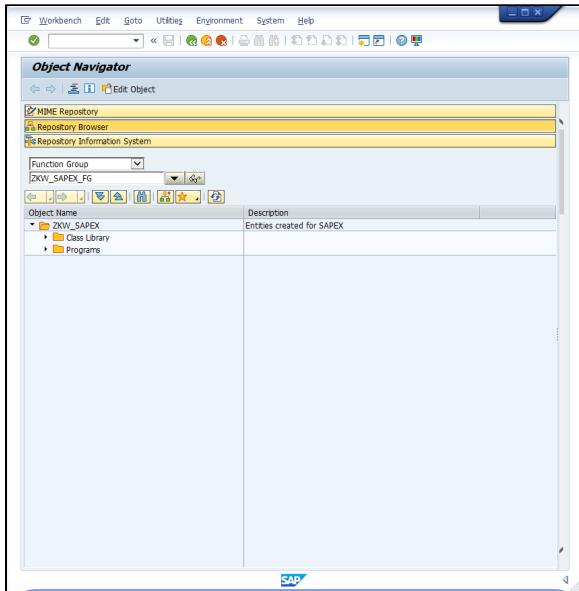

Configure remote scripts

1. Install RFC-enabled function modules

To run the SAPEX scripts from a remote host (where KLA is deployed), the `ZKW_SAPEX_*_RPC` function modules should be created using Function Builder (transaction **SE37**).

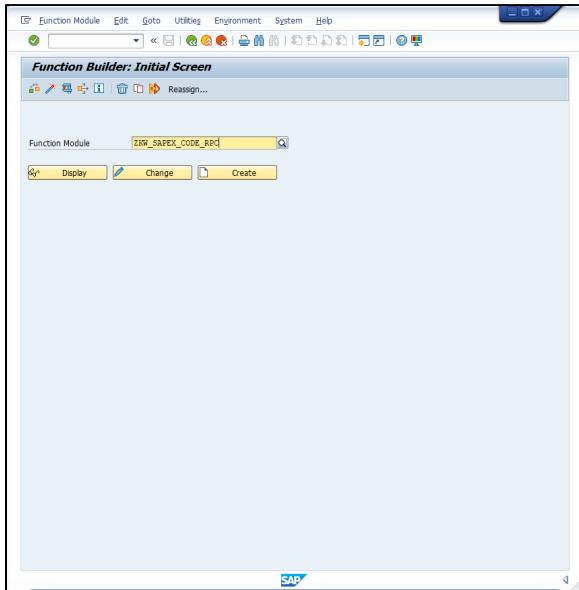

To create the `ZKW_SAPEX_FG` function group you can use transaction **SE80** as follows:

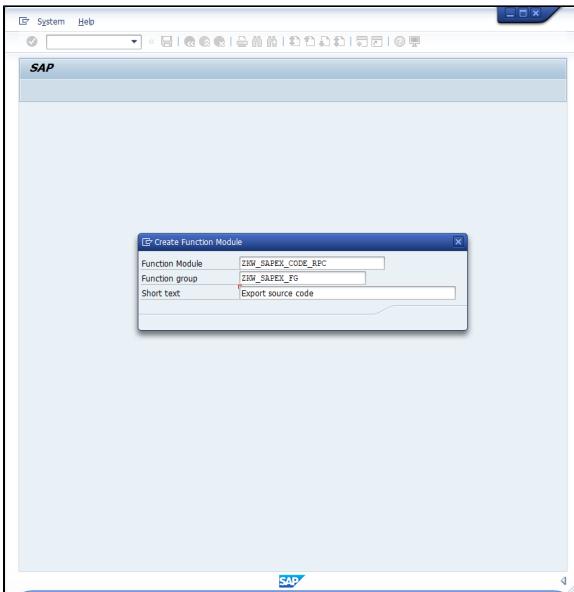

Before creating the function modules, it is recommended to create the `ZKW_SAPEX_FG` function group.

After creating the `ZKW_SAPEX_FG` function group, **create a Function Module for every `ZKW_SAPEX_*_RPC` function modules included in `$(AGENT_HOME)/resources/abap/.../ZKW_SAPEX_FG/functions`**

Use **Function Builder** (transaction **SE37**) as follows:

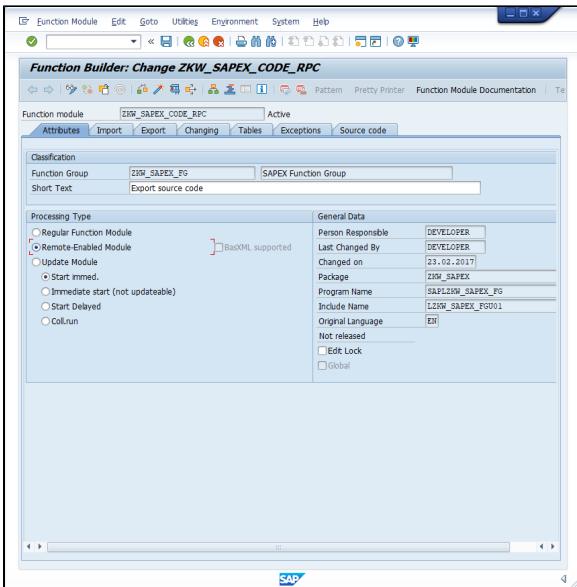

After created, go to the **Source Code** tab and paste the content of the associated file.

```

1> FUNCTION ZKW_SAPEX_CODE_RPC.
2>   *"Local Interface:
3>   *"  IMPORTING
4>     *"    VALUE(REQUEST_TASK_PATTERN) TYPE STRING DEFAULT ''
5>     *"    VALUE(DO_SUB_REQUEST_TASK) TYPE CHAR01 DEFAULT ''
6>     *"    VALUE(PACKAGE_PATTERN) TYPE STRING DEFAULT ''
7>     *"    VALUE(DO_SUB_PACKAGE) TYPE CHAR01 DEFAULT ''
8>     *"    VALUE(DO_PROGRAMS) TYPE CHAR01 DEFAULT 'X'
9>     *"    VALUE(PROGRAM_PATTERN) TYPE STRING DEFAULT ''
10>    *"    VALUE(DO_FUNCTIONS) TYPE CHAR01 DEFAULT 'X'
11>    *"    VALUE(FUNCTION_PATTERN) TYPE STRING DEFAULT ''
12>    *"    VALUE(FGROUP_PATTERN) TYPE STRING DEFAULT ''
13>    *"    VALUE(DO_CLASSES) TYPE CHAR01 DEFAULT 'X'
14>    *"    VALUE(CLASS_PATTERN) TYPE STRING DEFAULT ''
15>    *"    VALUE(DO_WEB_DYNPROS) TYPE CHAR01 DEFAULT 'X'
16>    *"    VALUE(NED_DYNPROS_PATTERN) TYPE STRING DEFAULT ''
17>    *"    VALUE(LANGUAGE) TYPE TI00-SPRSE DEFAULT 'E'
18>    *"    VALUE(CUSTOM_OBJECTS_ONLY) TYPE CHAR01 DEFAULT 'X'
19>    *"    VALUE(CUSTOM_NAMESPACE) TYPE NAMESPACE DEFAULT ''
20>    *"    VALUE(DO_SCREEN) TYPE CHAR01 DEFAULT 'X'
21>    *"    VALUE(DO_TEXTS) TYPE CHAR01 DEFAULT 'X'
22>    *"    VALUE(DIRECTORY) TYPE STRING DEFAULT ''
23>  *"  EXPORTING
24>    *"    VALUE(FILES) TYPE STRING_TABLE
25>    *"    VALUE(REPORT_OUTPUT) TYPE_STRING_TABLE
26>    *"    VALUE(OUT_DIR) TYPE STRING
27>
Scope: FUNCTION ZKW_SAPEX_CODE_RPC          ABAP  Ln 133 Col 13

```

Make sure that all functions terminated with `_RPC` are marked as RFC-enabled, as they will be called remotely from the SAPEX scripts.

Click **Save**.

2. Install SAP JCo Connector library

Remote scripts use SAP JCo Connector to remotely connect to the SAP server.

SAP JCO Connector must be installed in the remote containing the SAPEX remote scripts that will execute the Kiuwan Local Analyzer.

Full details for installing SAP JCo library

Download SAP JCo from [SAP Service Marketplace Connectors](#) - **you need service-marketplace access for it.**

Once you have downloaded the corresponding package for your operating system, install it.

- Windows:** There are different distribution packages for various JRE versions and hardware processors available:

file	platform
sapjco3-ntintel-3.0.8.zip	for a 32-bit JRE running on a 32- or 64-bit AMD or INTEL x86 or a 64-bit INTEL Itanium processor
sapjco3-ntia64-3.0.8.zip	for a 64-bit JRE running on a 64-bit INTEL Itanium processor
sapjco3-ntamd64-3.0.8.zip	for a 64-bit JRE running on a 64-bit AMD or INTEL x86 processor

Before installing JCo, please install the latest Microsoft Visual Studio 2005 C/C++ runtime libraries, as described in note 684106.

To install JCo for Windows unzip the appropriate distribution package into an arbitrary directory `sapjco3-install-path`.

Do not copy the sapjco3.dll in the `WINDIR\system32` nor into the `WINDIR\SysWOW64` directory. This will break the operability of other JCo versions that are already installed on the same system. Furthermore, you would risk that the current installation also would not work anymore if the sapjco3.dll gets replaced in the respective Windows system directory in the future.

- Linux:** There are different distribution packages for various JRE versions and hardware processors available:

file	platform
------	----------

sapjco3-linuxintel-3.0.8.tgz	for a 32-bit JRE running on a 32- or 64-bit AMD or INTEL x86 processor
sapjco3-linuxia64-3.0.8.tgz	for a 64-bit JRE running on a 64-bit INTEL Itanium processor
sapjco3-linuxx86_64-3.0.8.tgz	for a 64-bit JRE running on a 64-bit AMD or INTEL x86 processor
sapjco3-linuxppc64-3.0.8.tgz	for a 64-bit JRE running on a 64-bit PowerPC processor
sapjco3-linuxs390x-3.0.8.tgz	for a 64-bit JRE running on a 64-bit IBM eServer zSeries processor

To install JCo for Linux, copy the appropriate distribution package into an arbitrary directory `sapjco3-install-path`. Next, change to the installation directory:

```
cd sapjco3-install-path
```

and extract the archive:

```
tar zxvf sapjco3-linux*3.0.8.tgz
```

3. Configure SAPEX scripts in Kiuwan Local Analyzer

The last step is to configure the scripts used for the scripts in KLA for remote extraction.

Scripts for extracting source code (`sapexCode.xml`) and metadata (`sapexMetadata.xml`) use following configuration files:

- `sapex.properties`
- `sapexCode.properties`
- `sapexMetadata.properties`

You can find configuration files at `$(AGENT_HOME)/conf/sapex` directory of your Kiuwan Local Analyzer installation directory.

As an alternative, you may use the extractor programs provided in the SAP system, and then either transfer the results to the system where the KLA is deployed, or directly run the KLA in the target SAP system (in particular, when an automated audit should be performed before releasing a transport request /task).

Please note that the extraction programs for code / metadata allows you to specify a local directory (in the user host) where exported contents will be saved.

If the extract operations will be performed manually, remote extraction scripts are not needed.

Please visit [SAP Extractor- Remote use - Appendix Configuration Files](#) for further information.

Test SAPEX installation

Once completed, you may test the installation:

- You may run the [run the extraction programs in SAP](#) to check if programs and their dependencies are active.
- If the remote sapex was configured, [run command line scripts](#) to ensure that the connection properties and extraction filters work.
