# Kiuwan for Developers for Microsoft Visual Studio Code

This section will show you how to integrate the Kiuwan IDE Plug-In into Visual Studio Code.

The Kiuwan IDE Plug-In for Visual Studio Code is only available in Viewer Mode.

It has been successfully tested with VS Code 1.33.1

# Kiuwan IDE Plug-In

Kiuwan allows for a true **shift-left** approach by integrating with all the main IDEs.

**Kiuwan for Developers** is a **plug-in for development IDEs** that facilitates and automates compliance with **security** normatives, **quality** standards and **best practices** for several languages.

It provides the following benefits:

- Security Vulnerabilities Detection The plug-in allows developers to detect and fix security
  vulnerabilities, such as Injection (SQL, XML, OS, etc), XSS, CSRF, etc., directly within their
  development IDEs.
- Adoption of Security and Coding Standards The plug-in helps to ensure compliance to standards (CWE, OWASP, CERT-Java/C/C++, SANS-Top25, WASC, PCI-DSS, NIST, MISRA, BIZEC, ISO/IEC 25000 and ISO/IEC 9126) by automating the work. This plug-in connects with Kiuwan and harnesses the power of its quality models to prevent errors and automatically standardize the code.
- Automatic Error Prevention The plug-in implements and monitors compliance to coding standards at the time the code is entered. Thus you can avoid errors and reduce the time and cost of debugging and testing activities.

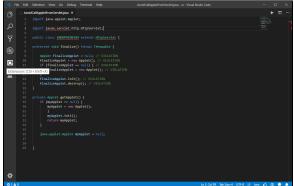

The Kiuwan IDE Plug-in monitors and reports on the security, quality, and efficiency of your code at the point that it is written. This immediate feedback provides you with the opportunity to improve your code before it is delivered.

## Installation

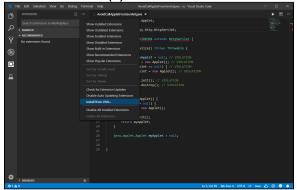

Before starting the installation, you must download **k4d-vscode.vsix** from https://static.kiuwan.com/download/vscode/k4d-vscode.vsix

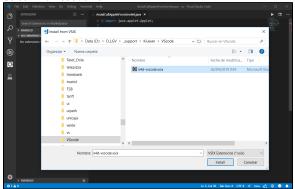

1. Click on Extensions

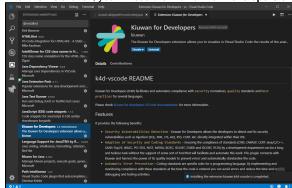

2. Click on More Actions (...) >> Install from VSIX

3. Select k4d-vscode.vsix

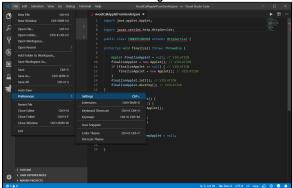

4. After the installation, you will see the Kiuwan for Developers extension.

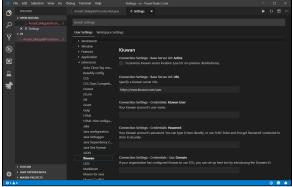

# Configuration

After installation, you need to **configure the Kiuwan IDE Plug-In to connect to Kiuwan**. Please remember that you need to have a valid Kiuwan Account.

1. Go to File > Preferences > Settings

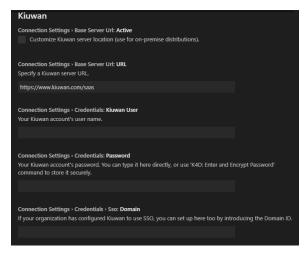

2. and select User Settings > Extensions > Kiuwan

## **Connection Settings**

You can find the connection settings at User Settings > Extensions > Kiuwan

Please remember that you need to have a valid Kiuwan Account.

The Kiuwan server URL comes preconfigured (leave it with default value).

- This field only needs to be modified in case you are using Kiuwan On-Premises (KOP).
- If you need to modify it (to set your KOP server URL, check Customize Kiuwan Server location)

Fill in the User and Password fields with your Kiuwan account credentials.

If your Kiuwan account is configured to use **Single Sign-On (SSO)**, enter your **Domain ID** (consult your Kiuwan admin and see How to integrate Kiuwan with SAML SSO)

To check the connection, you can use **K4D: Check Connection With Current Settings** to select the delivery. See Kiuwan VS Code commands

# Mapping your VS Code folder or workspace to your Kiuwan Application

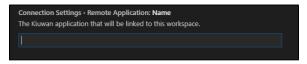

After the Kiuwan IDE Plug-In is installed, you are ready to map your VS Code workspace or folder to a Kiuwan application.

This action will allow synchronizing defects and vulnerabilities found by Kiuwan in your source code, getting them ready for fixing.

All the following settings can be configured at **User level** (i.e. they will apply to all folders opened with the user currently logged in the machine), or at **Workspace level** (i.e. you can configure different values for different folders/workspaces); the later is recommended.

To map your VS Code workspace to Kiuwan, type your Kiuwan app name at Remote Application: Name

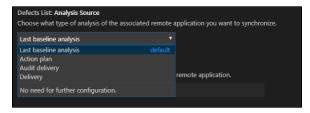

Leaving it blank, you can use K4D: Pick Remote Application to select the app.

See Kiuwan VS Code commands

#### Source of Defects

Once mapped, you can select the **source of the defects** that will be shown in VS Code.

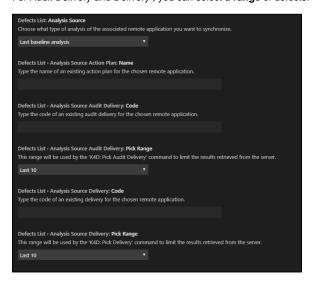

Depending on your needs, the **source** of server defects could be different:

- · Last baseline analysis
  - All the defects found during last complete application analysis (i.e. the Application Baseline)
- Action plan
  - Defects included within an Action Plan (you must type the plan name)
  - Leaving it blank, you can use K4D: Pick Action Plan to select the action plan. See Kiu wan VS Code commands
- Audit Delivery
  - Defects that must be fixed so the Audit of a delivery can be successfull (you must type the delivery name)
  - Leaving it blank, you can use K4D: Pick Audit Delivery to select the delivery. See Kiu wan VS Code commands
- Delivery
  - Defects found for the delivery analysis of the mapped application

 Leaving it blank, you can use K4D: Pick Delivery to select the delivery. See Kiuwan VS Code commands

For Audit Delivery and Delivery, you can select a range of defects.

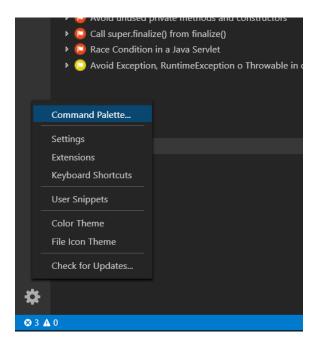

## **Limiting and filtering Defects**

Finally, you can limit how many defects to download from Kiuwan servers (**Defects Limit**), as well as filter the resulting set of defects by **Characteristics**, **File Patterns**, **Language** and **Priority**.

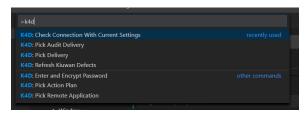

#### **VS Code commands**

Select Command Palette..

to use the following list of Kiuwan VS Code commands

For example, if you select Delivery as the source for defects, you can select the right delivery by running K4D: Pick Delivery and selecting among the available ones.

# Viewing Kiuwan defects in VS Code

Once configured, just click on the Kiuwan icon to see the defects.

This 'tree of defects' is structured in two or three levels:

#### 1. Rule:

- The first level represents 'the rule' which generated the defect.
- If you select it, the bottom section **Details** will refresh its contents, showing important information about that rule.
- You can also right-click on it and select Show rule documentation in Kiuwan and K4D will open a new tab of your system web browser, pointing to Kiuwan, to show you all existing details about the rule.

#### 2. Defect:

- The second level is populated with defects found of the selected rule.
- The **Details** section will now show information that affects only selected defect, and K4D will try and find the reported file and line among your local sources, to open it in a new editor tab.

#### 3. Propagation path:

 The last level will show you all the locations of the code crossed by a security vulnerability, so you can track it, and neutralize it.

# Support and Troubleshooting

If you experience problems with the Kiuwan plugin for VS Code, read the Kiuwan Documentation to find a solution, or if you prefer you can collect troubleshooting information and send it to us.

### **Support Information**

Important information for troubleshooting is located in the log file.

To make this process easier find log file at \$USER\_HOME/.optimyth/k4d-vscode.log and submit to technical support team.

Visit Contact Kiuwan Technical Support on how to contact us. We will address your problem as soon as possible.
