How to Deactivate a Rule

This guide explains how to deactivate a Kiuwan rule and create a custom model.

Contents:

- · What are rules and models
- See which model you are using for your application
 Create a new model from the CQM model
- · Create a new custom model when I already have one

What are rules and models

When you execute a Kiuwan analysis, Kiuwan applies a set of rules to your source code. For example, some rules may scan for SQL-Injections vulnerabilities, other ones might search for path-traversal issues, etc.

The concrete set of rules being applied to your analysis is called a Model.

Kiuwan's ruleset contains more than 3000 rules, but not all of them are activated by default.

Saying that CQM is the default model means that any application you create is, by default, scanned applying the active rules contained within CQM.

Every application is associated with a specific model. If you don't make any configuration, every new application is associated with CQM, and therefore the rules to be applied are those active in CQM.

Sometimes, and for different reasons, you need to de-activate a Kiuwan rule (see How to manage Kiuwan defects when I do not completely agree with them).

To de-activate a rule means that Kiuwan will not execute that rule's validation. The reasons can be of different nature (you are not interested in the validations the rule is performing, the rule for some reason is producing many false positives or any other reason).

To deactivate rules you do not need, create your own custom models and associate different models to different applications.

See which model you are using for your application

If you are using Kiuwan Local Analyzer GUI, click Advanced to see which model you are using.

A window will be displayed like this:

natic		
matic		-
ERS		
EKS		
		0
/test/**	**/MACOSX/**	• •
nin.js	**/*.Designer.vb	•
		8
	nin.js eference.vb lverlight.vb eference.cs lverlight.cs	iin.js **/*.Designer.vb iference.vb **/*Service.vb Iverlight.vb **/*.Designer.cs iference.cs **/*Service.cs

If the Analysis model field value is Automatic, CQM is used by default.

If you are using any other model, another name is displayed.

Another way to know the model is through the Kiuwan website. Go to **Application Management**, find your application and select **Model** from the drop-down menu on the right.

Create a new model from the CQM model

(i) CQM is the default Kiuwan model, and it's read-only. You can use it but you cannot modify it.

If you are using CQM and you want to modify it (for example, deactivating a rule), you must follow the next steps:

- Create your own custom model (most probably as a copy of CQM) To create your custom model please follow instructions detailed at Advanced Model Management#CreatinganewModel
- 2. Find the rule and deactivate it Go to the Rules tab of your custom model and find the rule using the filters (Rules Management#Rulessection)

A rule is identified by two fields:

- Its name
 - for example, "Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')"
- Its rule code
 - ° for example, OPT.JAVA.SEC_JAVA.SqlInjectionRule

So you can search the rule either by its name (or description)

	RULES							
Active	Name or description Language Characteristic Vulnerability type P	Priority		Effort	Normative	Framework	Tag	
On M	Infine Proper Neuro Q		•	•	•	•	Find •	0
i or	ly Code Security rules

or by its rule code (in this case you must first enable the rule code filter as in the image below)

Click the green circle to de-activate or activate it.

3. Publish your model - All the changes made to the model are saved in a Draft version.

To make the changes publicly available, click **Publish** and provide a version tag.

UMMARY INDICATORS RU	PUBLISH MODEL	×	15/04/01-	2019/06/05 👻	PUI
yModel + Version 2019/06/0					
	Publication tag*				
RULES	The publication tag will be shown in the model versions dropdown. You can easily identify a version of a model by its publication tag.				
ctive Name or	26		stk.	Tag Find	0
de code	* Related rules		-		
LAVA SEC_ Q D Only	This model contains rules that have one or more related rules that you should check before publishing				
	Incompatible rules may cause duplicated violations in your analyses.				
	Generalized rules should be replaced by their generalization.				
	Deprecated rules should be avoided. Use the rule that deprecates them instead.				
orne dhangen were mi	Avoid capturing java.lang.Exception exceptions				~
32	Avoid duplicated SQL statements		Priority	Repair difficu	ity
reproper Neutralization CERT el DIOD 1 CWE Sea	If a CURSOR is declared FOR UPDATE, DELETE and UPDATE must be used with the WHERE				~
OWNER-2012.A1 OWNER-2		PUBLISH			
		10000			ดะ

Once published, any new analysis of an application associated with this model will use this latest version.

4. Associate your application to your custom model and run again the analysis - Find your application in Application Management, click Model and select the created model.

APPLICATIONS PORTFOLIOS	MODEL			×
	Model parameters			í.
Appecasions Business value	Model	COM V	Select a Model for this application. You can edit/create	
		CQM_salado CQM_salado	Models from the 'Models Management' option.	Clear
Add	Force model in deliveries	CQM_shiftek CQM_spirade	By default, a delivery use the	Bulkactions 👻
Name		CQN_teamunit CQN_Telef	model and version used in its baseline. If this option is checked, the delivery will use	burce code upload
PathTraversal		CQM_URI CQM_YB	the last version of the model.	*
lana Jou	Characteristic Target	CQM_WebGoat8 CQMJuliete COMJuliete2	CQM (checking Quality Model) is based in several categories.	* *
		Portability 90 0	You can define your target (a value between 0. 100) for each category: 0. 30 is the red rose.	· · ·
_66922				SAVE Y

Now, when you run the analysis of the application, your custom model is used.

Create a new custom model when I already have one

If you are already using a custom model, follow steps #2 (Find the rule and deactivate it) and #3 (Publish your model) as described above.

Then, re-run your analysis.
