Which are the main indicators provided by Kiuwan Code Security?

The main indicators provided for Kiuwan are the following:

- **Software characteristics**
    - Security, efficiency, maintainability, reliability, and portability
- **Global Indicator**
    - The weighted average of the above software characteristics through a complex algorithm. This considers the severity of the defects, the weight of the category in which the defect is, the analyzed code volume, and the criticality of the language for Kiuwan users. This algorithm can be customized.
- **Effort to Target**
    - The amount of work effort needed to reach a defined goal.
- **Risk Index**
    - A representation of the potential problems that could arise by not paying attention to the security and quality of your source code. Any value greater than 0 should be observed and actions should be done to decrease the number.
