

Kiuwan On-Premises Distributed Version

Kiuwan On-Premises is the on-premises version of Kiuwan SaaS, providing full Kiuwan functionalities but completely deployed on your own premises.

It is an alternative to the cloud solution for those customers who prefer to maintain a private instance completely managed within their own infrastructure. It can be installed on a single host or on multiple hosts (externalizing one, some or all of the provided infrastructure services).

Within your own environment, you can easily integrate Kiuwan On-Premises into your development cycle:

- Desktop development platforms (Eclipse, Visual Studio, Visual Studio Code, JetBrains)
- Continuous integration platforms (Jenkins, Microsoft TFS/VSTS, IBM UrbanCode, CloudBees, CircleCI, JetBrains, TeamCity, etc)
- Issue tracking software (JIRA)
- Other enterprise environments like SAP, etc.

The Kiuwan On-Premises documentation contains these guides:

- [Kiuwan On-Premises Distributed System Architecture](#)
- [Kiuwan On-Premises Distributed Installation Guide](#)
- [Kiuwan On-Premises Distributed Upgrade Guide](#)
