

How does Kiuwan Code Security help me make decisions on how to fix my application?

Kiuwan Code Security provides a module to create [Action Plans](#), i.e. concrete and defined sets of goals and actions to be performed on your application to improve your code.

There are two options:

1. Build an Action Plan based on the criteria that are more important to you (available man-power, high-security vulnerabilities...)
2. Ask Kiuwan Code Security to build an Action Plan for you based on your preferred strategy (e.g. I want to reach a 5-star rating)
