

# END2END APPLICATION SECURITY

REDEFINE  
SCOPE.

# BASICS

- **Continuous SAST analytics for the entire SDLC**
- 30+ Technologies
- Discover Open source vulnerabilities and license compliance
- DevSecOps approach to securing your applications
- Web, Mobile, and Legacy systems supported
- OWASP, CWE, SANS 25, PCI-DSS, HIPAA, WASC, MISRA-C, BIZEC, ISO 25000, CERT-C, CERT-J.

Kiuwan provides an end-to-end platform that

## TACKLES

all the application security needs with a wealth of software analytics in a light, state-of-the-art platform

by addressing how to resolve common pain points found in any Enterprise with a Shift Left and DevSecOps methodology approach which can be implemented in all the stages of the SDLC.

**Implementing** light and flexible tools within any Enterprise is paramount to the success of their developments. Many companies face supplier risk, not being able to understand how the behavior of a provider affects their Time-to-Market, unable to extract data driven analytics regarding the performance of both in-house or external developments.

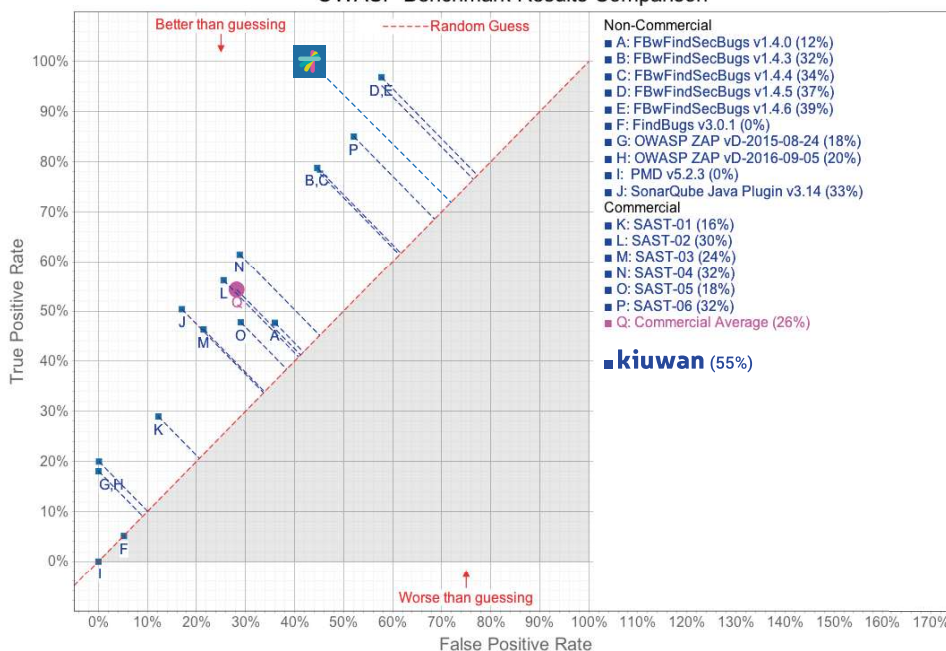

**Discover** which apps can go on to testing phase, what business areas and apps are more prone to security vulnerabilities, even as far as establishing technical SLAs to a development provider.

**Improve** existing applications with less effort and learn where you need to invest more by knowing the criticality and risks associated within your application portfolio.

## OWASP Benchmark

Kiuwan detects **100%** of all OWASP Top 10 vulnerabilities

OWASP Benchmark Results Comparison

# Application Security Solutions

The possibility of end-users interacting directly with business actions without an intermediary opens up the possibility of directly exposing system vulnerabilities, users without previous training can take actions on the systems and affect their functionality and security vulnerabilities are open to a much wider range of people who may discover leaks and perform security attacks.

With all these needs the development of secure systems becomes

# ESSENTIAL.

## Application Risk Governance

Know the security risk you are facing in your Enterprise application portfolios, understand the weak areas and learn how to prioritize efforts. Make informed decisions based on a real snapshot of what risks you face.

## Secure Application Development

The product is the center of development, it is the object of measurements and tests. So why can't teams use the same tools to see those results? Non-sharing produces useless delays in detecting and correcting vulnerabilities and defects. It's not Agile.

Through the implementation of a DevSecOps approach, Kiuwan provides continuous and early vulnerability detection which can be implemented at different stages of the SDLC through Automatic Threat Evaluation.

Discover what risks you face from third party libraries within your open source components, as well as possible license compliance issues derived from these.

## Application Audit

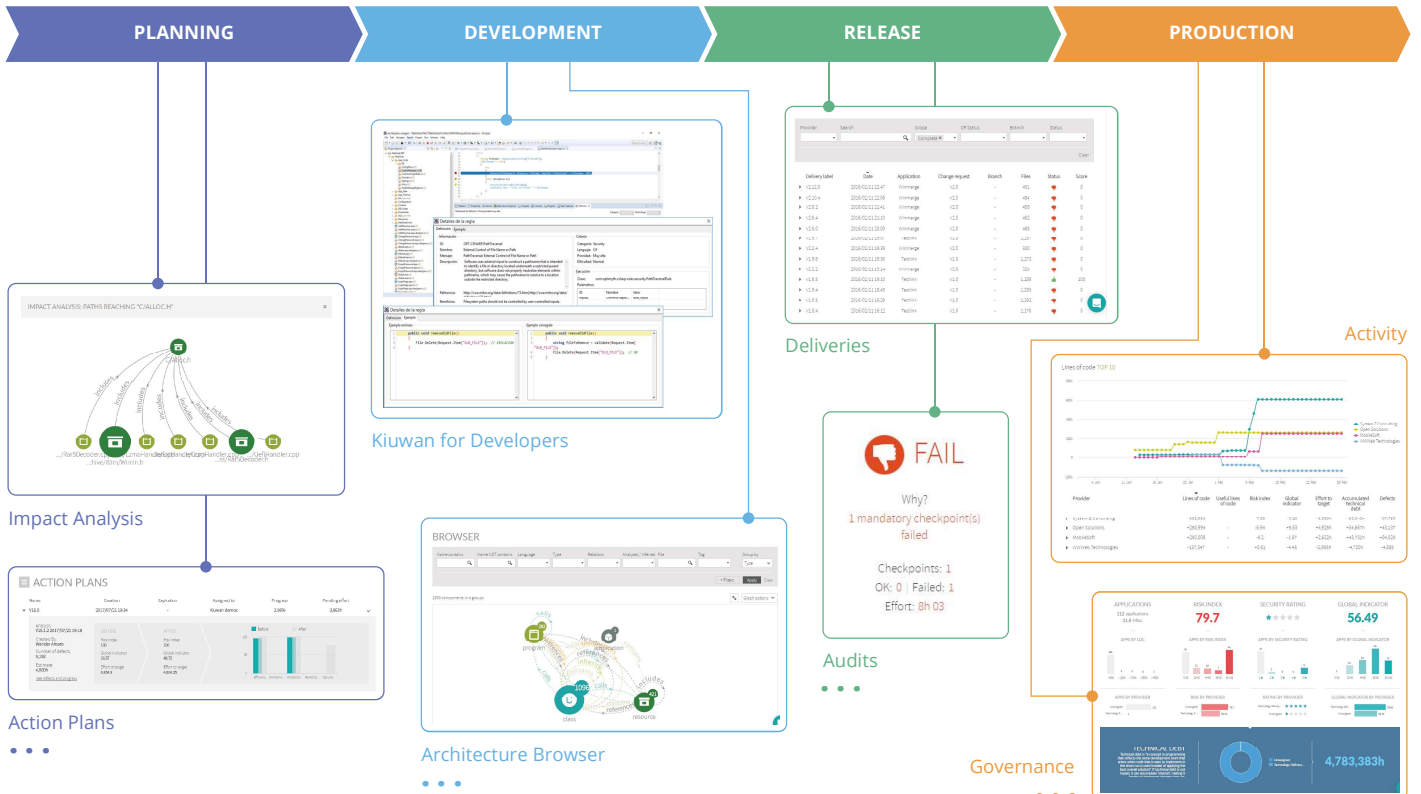

Place automatic audits on application changes to enforce security with seamless integration within your existing CI and IDE tools, as well as being able to track the readiness of development teams and outsourcers based on their audit results.

## Application Security Architecture

Define and enforce secure application architecture with a complete map of application components. This way you can easily find the weakest link in your applications and remedy potentially dangerous migrations or simply being aware of risky dependencies within your portfolio.
