**ferrovial**

## **ABOUT**

Ferrovial is a Spanish multinational company involved in the design, construction, financing, operation and maintenance of transport, urban and services infrastructure. A publicly traded company, part of the IBEX 35 stock market index, the company is headquartered in Madrid.

## **NEED**

*Gilberto Florez, QA & IT Architecture and Integration Manager*

With a multi technology environment for our devs, we sought a solution that could encompass unlocalized teams globally distributed, working in complex environments with different programming languages and technologies.

We needed quality assurance with regards to the main quality code parameters (maintenability, security, reliability, etc.) of our applications and also the development deliverables, ideally with a centralized platform since we required governance of our application portfolio that gave us objective data to drive our decisions.

We found the application governance, deliveries control & the analysis of our entire portfolio to be very compelling, given it went beyond our initial scope of need.

## SOLUTION

Kiuwan's hybrid solution, both as a SaaS and on-premise proved ideal in finding a solution for the collaborative work needed between our internal teams and our external providers. With no need to invest in infrastructure or extra effort, their multi-technology solution encompasses the entirety of our application stack.

## IN DETAIL

- Standardization of the measurements of quality and security with an minimal executable set model
- Have a baseline of the state of quality and security of the applications and associated technical debt, based on market best practices standards.
- Specific plan of action that improves the quality and security for each of the applications.
- Analysis and integration into the lifecycle of the status of development deliveries and obtainment of reports of defects and specific vulnerabilities introduced in each one.
- Automatic countable contractual SLA on delivery of the applications, based on measured levels of quality and security, enforcing suppliers adherence.
- Calculation of the rest of the AM SLAs and integration within a Balanced Scoreboard
